

Step 1.
Create an ugly mindmap.

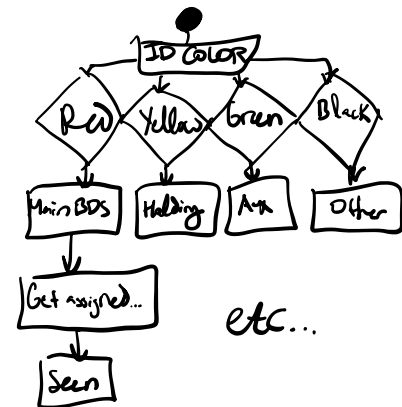

Step 1.5
Google.

“How to do mass casualty triage”
“FEMA mass casualty”
“Mercy ship staffing”

Avoid the rabbit hole. Just
what you need to solve the
problem.

Also, you don't need a degree
to grasp concepts or topics.

Step 2.
Create an ugly activity diagram.

Step 3.
Ask yourself if you make any sense.

“Do I have a bunch of problems in my mindmap instead of just one?”

“What is my scope?”

“Am I too abstracted or not abstracted enough?”

Realize you have a flaw in your activity diagram and make a new one

“Oh crap, I completely forgot to account for waiting time in my diagram.”

Ask other people.
Leave it for awhile.
Walk / gym.

*** Now PAUSE ***

“Always be ahead of the machine.”

If you feel like you don't understand part of
what you're setting out to do, stop and flesh
that out further.

Step 4.
Write pseudocode.

Outline your code with comments.
Outline before writing...

Towards Data Science
Geeks For Geeks
Academic Papers*
*sometimes

Step 4.5
Literature review...

"How to track data in Python"
"What is Pandas Python"
"ER triage simulation article"

ChatGPT: I am writing a simulation in Python using Simpy. Please give examples of how I create an instances and use them in a system.

ChatGPT doesn't judge you for asking
to explain like you're five...

Step 5.
Write what you know.

If you can code `my_variable = 2` start with variables...
Imports are a great start too.

Never copy and paste from ChatGPT.
If you don't know what each line is
doing, learn more first.

Step 6.
Suffer.

"How do I feed my object to the system?"

ChatGPT: Why does my code give a `TypeError` and how do I fix this?
Explain what I did incorrectly.

"Numpy documentation .random"

"What is a normal distribution that is only positive numbers"

UNDERSTANDING

QUICK COMPLETION

If you don't understand it, you might be totally
doing the wrong thing...
